For use in conjunction with CanVIG-UK Consensus Specification for Cancer susceptibility Genes of ACGS Best Practice Guidelines for Variant Classification. Evidence lines for which there are no gene-specific recommendations should be reviewed in context of CanVIG-UK Consensus Specification for Cancer Susceptibility Genes.

## Evidence towards Pathogenicity

Evidence element and evidence strengths allowed	Thresholds/data-sources/applications specifically relevant to SDHB, SDHD																																																							
<b>PS4: Case-control:</b> The prevalence of the variant in affected individuals is significantly increased compared with the prevalence in controls	_VSTR _STR _MOD _SUP	<ul style="list-style-type: none"> <li>• For variant data presented in Garrett et al 2021<sup>1</sup> (6,118 cases including data from Birmingham and Leeds NHS laboratories up to 2020; ethnicity of cases not all known)                             <ul style="list-style-type: none"> <li>• if variant frequency in GNOMAD <math>\leq 1</math> in NFE and 0 in all other ethnicities in GNOMAD and 1KGP                                     <ul style="list-style-type: none"> <li>→SUP if cases <math>\geq 2</math> (<math>p=0.002</math>), MOD if cases <math>\geq 4</math> (<math>p=0.000006</math>)*</li> </ul> </li> </ul> </li> <li>• Where there are cases with the variant in addition to those included in Garrett et al 2021<sup>1</sup> <ul style="list-style-type: none"> <li>• if variant frequency in GNOMAD <math>\leq 1</math> in NFE and =0 in all other ethnicities in GNOMAD and 1KGP</li> <li>• and cases are non-overlapping                                     <ul style="list-style-type: none"> <li>→SUP if cases <math>\geq 3</math>, MOD if cases <math>\geq 5</math>*</li> </ul> </li> </ul> </li> </ul> <p>*These point allocations are very conservative to account for potential heterogeneity in case ethnicity and/or case ethnicities not represented in either gnomAD/1KGP</p>

		Evidence points <sup>c</sup>																																																						
		SDHB	SDHD																																																					
Phaeochromocytoma/ paraganglioma (must meet PM2 MTAf)		+2	+1																																																					
Head & neck paraganglioma	present	+0.5	+3																																																					
	absent	-0.5	-3																																																					
Family history <sup>a</sup>	present	+3	+4																																																					
	absent	-	-1																																																					
Invasive disease	present	+2	-																																																					
	absent	-0.5	-																																																					
Multiple tumours	present	+0.5	+2																																																					
	absent	-	-																																																					
SDHB immunohistochemistry (IHC)	loss	+3	+3																																																					
	normal	-1	-2																																																					
Succinate:Fumarate ratio (S:F) <sup>b</sup>	High (>97)	+3	+3																																																					
	Low (<97)	-	-																																																					
<b>PP4 (BP5): Phenotypic specificity/case counting</b> (Patient's phenotype or family history is highly specific for a disease with a single genetic aetiology)	_VSTR _STR _MOD _SUP	<p><sup>a</sup> Presence of phaeochromocytoma/paraganglioma in first/second degree relative</p>																																																						

<sup>b</sup> Validated assay performed in accredited diagnostic laboratory or laboratory publishing on S:F ratio. These evidence points have still been applied conservatively to account for variation in assay performance and lack of replication outside of reference publication.

<sup>c</sup> Evidence points have been derived from the likelihood ratios in Garrett et al 2021<sup>1</sup>. For the clinical subphenotypes, the LR<sub>s</sub> from adjusted multiple regression have been used. The exponent of the lower 95<sup>th</sup> confidence interval has been used: where this is 0-1, it has been rounded to 0.5 where the point estimate of the exponent is >1. For negative LR<sub>s</sub>/exponents (i.e. towards benignity), the upper 95<sup>th</sup> confidence interval is used.

Notes

- Points contributing to PP4/BP5 should be summed
- Where there are multiple cases with the variant reported clinically/in the literature, points for each clinical/molecular subphenotype (family history, head and neck, multiple tumours, invasive tumours, IHC loss, S:F ratio) can only be used once. Points for different subphenotypes can be awarded for different individuals/family members carrying the variant
- Where there are clinical data from multiple probands/family members that are discordant for a clinical subphenotype, only the positive score is counted (e.g. for a *SDHD* variant that has been reported 3 times, of which 1 is familial and two are isolated, 4 points are awarded).
- If there are conflicting data for two different IHC tests, no points should be awarded for IHC (S:F can still be awarded in this instance, independent of IHC). If IHC and S:F are discordant, the net score can be used. No more than 3 points can be awarded for the combination of IHC and S:F
- Points for LOH (as per consensus CanVIG guidance) can be awarded independently to (i.e. in addition to) IHC and S:F, as it is an orthogonal test
- If all the data for a variant come from a single case/family OR from a single-centre publication, points for PP4 should not exceed 4 (and the variant should not be classified at higher than likely pathogenic)

<p><b>PM2: Absent from controls</b> (or at extremely low frequency if recessive) in ESP, 1000GP, or ExAC</p>	<p><b>_MOD</b> <b>_SUP</b></p>	<p>For PM2_mod frequency should be below predicted maximum tolerated allele frequency (MTAF) using the threshold below:</p> <table border="1" data-bbox="587 1361 1145 1435"> <thead> <tr> <th>SDHB</th> <th>SDHD</th> </tr> </thead> <tbody> <tr> <td>1.7 x 10<sup>-6</sup></td> <td>7.3 x 10<sup>-7</sup></td> </tr> </tbody> </table> <p>For PM2_sup follow main consensus specification recommendations (≤0.002% in a cancer-free control series of &gt;50,000 individuals or any equivalent ratio in a larger control series)</p>	SDHB	SDHD	1.7 x 10 <sup>-6</sup>	7.3 x 10 <sup>-7</sup>

Location outside enriched region	-	-1												
<b>PS3: Functional:</b> Well-established in vitro or in vivo functional studies supportive of a damaging effect on the gene or gene product	<b>_VSTR</b> <b>_STR</b> <b>_MOD</b> <b>_SUP</b>	No variant-specific ex-vivo assays established as robust.												
<b>PP1: Co-segregation</b> with disease in multiple affected family members in a gene definitively known to cause the disease	<b>_VSTR</b> <b>_STR</b> <b>_MOD</b> <b>_SUP</b>													
<b>PS2/PM6: De novo</b> (maternity and paternity confirmed/unconfirmed) in a patient with the disease and no family history	<b>_STR</b> <b>_MOD</b> <b>_SUP</b>													
<b>PM3: in trans</b> with a pathogenic variant ( <b>recessive disorders</b> )	<b>_STR</b> <b>_MOD</b> <b>_SUP</b>													
<b>PP5: Reputable source</b> recently reports variant as pathogenic, but the evidence is not available to the laboratory to perform an independent evaluation	<b>_VSTR</b> <b>_STR</b> <b>_MOD</b> <b>_SUP</b>													

### Evidence towards Benignity

<b>BA1/BS1: Allele frequency</b> is “too high” in ExAC or gnomAD for disorder	<b>_SA</b>		
	<b>_STR</b>		
		SDHB	SDHD
	BS1	1.7 x 10 <sup>-6</sup>	7.3 x 10 <sup>-7</sup>
	BA1	10 <sup>-4</sup>	10 <sup>-4</sup>

<b>BS2: Observation in controls</b> inconsistent with disease penetrance. Observed in a healthy adult individual for a recessive (homozygous), dominant (heterozygous), or X-linked (hemizygous) disorder, with full penetrance expected at an early age	_STR _SUP	
<b>BP4: In silico:</b> Multiple lines of computational evidence suggest no impact on gene or gene product (conservation, evolutionary, splicing impact, etc.)	_SUP	
<b>BP1: Missense variant in a gene for which primarily truncating variants are known to cause disease</b>	_SUP	
<b>BP7: Synonymous</b> (silent) variant for which splicing prediction algorithms predict no impact to the splice consensus sequence	_SUP	
<b>BP3: In-frame deletions/insertions in a repetitive region</b>	_SUP	
<b>BS3: Well-established <i>in vitro</i> or <i>in vivo</i> functional studies</b> show no damaging effect on protein function or splicing	_STR _MOD _SUP	
<b>BS4: Non segregation with disease</b>	_STR _SUP	
<b>BP2: Observed in trans with a pathogenic variant</b> for a fully penetrant dominant gene/disorder or observed in cis	_STR _SUP	
<b>BP6: Reputable source</b> recently reports variant as benign, but the evidence is not available to the laboratory to perform an independent evaluation	_STR _SUP	
<b>BP5:</b> Alternate molecular basis for disease	_SUP	

### Version History/Amendments

Revised version	Date	Section	Update	Amended by	Approved by
1.1	04/03/22	All	Draft version for consultation with CanVIG	CT	CStAG
1.2	16/03/22	PP4	Addition of LOH Clarification of use of S:F in context of contradictory IHC	CT	CStAG
1.3	24/03/22	PM2	Application of PM2_sup as per main consensus guidance	AG	CStAG
